T1/2/3 Optimizations	1
Overall Score	2

Recap and Feedback

KPIs

Writing

Self-Evaluation:

Please briefly share your reflections on how this KPI went. Questions to consider in your reflection: *What went well/badly? What was easy/difficult? What did I learn? What do I still need to learn more about? What could I have done better?*

For this quarter, the KPI was heavily based on creating blog content to promote WPChat on Smash Balloon as well as the WPChat website itself.

As with other plugin releases, the starting period took a little getting used to, but it was still pretty manageable overall.

Since the writing schedule post WPChat release was relatively heavier, the various Custom GPTs on Chatty turned out to be a huge help when it came to the writing. I managed to streamline the entire process a lot more this quarter, which definitely helped me deal with the schedule.

The time spent outlining, drafting, and writing each article has gone down compared to the previous quarters, and I'm still trying to look for ways to optimize the process.

While I have a system in place, one minor issue is that Custom GPTs seem to be slightly biased towards producing similar phrases even with different inputs. I'm still experimenting and trying to learn more in this regard, but I'm happy with all the progress I've made so far.

While AI made things easier, the change in posting schedule once WPChat was close to release did cause some difficulties balancing out the other tasks.

Overall, I'm optimistic about the next quarter. When it comes to self-improvement, a big priority for me would be to streamline the process of creating TOFU and non-tutorial blog posts with the help of all the tools available to me.

Please share your scoring reasoning (ie "I shared a X score on this KPI because...")

I put a score of 1 for this KPI because I still see a significant room for improvement, especially in regards to more in-depth posts.

Supervisor Feedback

I am updating this score to a 2. You delivered a high volume of content under tight deadlines for the WPChat launch, which was essential for getting the new site off the ground. Managing that increased workload without missing a beat on the Smash Balloon blog is a strong achievement.

However, regarding your note on AI producing "similar phrases," we need to be careful. Speed is great, but distinctiveness is what ranks. If our posts start sounding repetitive, we risk looking like low-quality programmatic content to both Google and our readers. For Q1, I want you to treat the AI output as a rough draft, not a final product. Your value adds comes from the "human polish": injecting unique examples and varying the sentence structure so that our efficiency doesn't dilute our brand authority.

Product Knowledge

Self-Evaluation:

Please briefly share your reflections on how this KPI went. Questions to consider in your reflection: What went well/badly? What was easy/difficult? What did I learn? What do I still need to learn more about? What could I have done better?

With the release of a new plugin, I had to spend a bit of time using WPChat and understanding what it offers so I could confidently create marketing content for the plugin.

After a little adjustment period, I feel that I have a good handle on the plugin's features and use cases. It definitely helped that the Marketable Moment documentation and other resources (changelogs, videos, documentation, direct contact with developers) were available as well.

As new features for the plugins are released, having these resources made it easier to understand what new benefits I could promote to the readers as well.

At the same time, I'm still trying to work on new promotional angles and use cases for our products. A big reason for that is that it would be a huge help in finding new target keywords to write posts about, and it'd make the content for each new post easier to differentiate from the existing ones.

For the next quarter, I'm hoping to make some more progress in this regard, for WPChat as well as our other plugins.

Please share your scoring reasoning (ie "I shared a X score on this KPI because...")

I shared a score of 2 because I believe that I have a good grasp of the Smash Balloon products, the features, and their use cases for the readers.

Supervisor Feedback

I agree with the score of 2. You have demonstrated a solid technical understanding of WPChat, and your ability to translate changelogs and documentation into customer-facing content quickly was a key part of the launch's success.

However, to truly drive growth, we need to evolve "Product Knowledge" into "Customer Insight." You correctly identified the need for "new promotional angles," and this is where we can unlock real value. Instead of just documenting features, we need to leverage that knowledge to identify underserved user needs and create narratives that differentiate us from the competition.

For the next quarter, I want you to focus on the application of your knowledge. How can we use your understanding of the product to capture new keyword intent or solve specific business problems? We will define specific, quantifiable metrics to track this strategic shift in the Looking Ahead section below.

Rocks

At least 15 points of Individual KPIs

Self-Evaluation

In 3-5 sentences, please summarize what you did for this Rock.

For this Rock, I worked on content for the WPChat and Smash Balloon blogs, which were the largest portion of the workload this quarter.

On top of that, I also prepared rewrites and updates to account for new Marketable Moments or just to keep the content fresh and help them rank higher. While most of the emails this quarter were related to Black Friday, I still scheduled 2 weekly newsletters.

Please briefly share your reflections on how this rock went. Questions to consider in your reflection: What went well/badly? What was easy/difficult? What did I learn? What do I still need to learn more about? What could I have done better?

For this quarter, my weekly KPI at the time of the final L10 meeting of the year was unfortunately 14.7. At the same time, I managed to complete the remaining T123 optimization and other minor updates after the L10 but before the quarter actually ended.

Even though I managed to get the tasks done, I would have liked to have finished them in advance. Since the change in posting schedule around the time of WPChat's release caused other rewrites and optimization tasks to be pushed back towards the later part of the quarter, I should have foreseen this issue beforehand.

For the specific tasks in this Rock, the biggest portion of my time was spent on creating blog content for Smash Balloon and WPChat.

I'm happy that I was able to keep up with the posting schedule, despite the addition of a new blog and changes in the posting calendar. As mentioned before, I was able to get more use out of AI tools this quarter, which definitely helped with the schedule.

On top of regular posts, I also worked on rewrites as usual, although the rewrite volume was a lot less compared to Q3 2025. I updated older posts to account for new Marketable Moments, changes in plugin features, and the removal of ClickSocial as a service.

At the same time, I'm also continuing to work on experimental rewrites, although at a lesser volume, just like with the other rewrites. A lot of the tests this time involved changes in the presentation of information so the main priority of the article is clearer to AI. It's a different approach compared to some of the older experiments (which focused on amplifying the "human" voice) so I'm curious what the results will show in the long run.

I also worked on announcement posts and emails for the various Marketable Moments this quarter. This includes these 3 posts:

- *[NEW] Introducing WPChat: The Best WordPress Chat Plugin for Better Customer Support*
- *[UPDATE] Take Control of Your Facebook Video Feeds: Filter Reels & Videos*
- *[UPDATE] WPChat 1.2: Go Global with RTL Support & Enhanced User Experience*

*The announcement email for WPChat's release had an open rate of 3.41% and a CTR of 0.08% for the **Lite users**, open rate of 15.75% and a CTR of 0.12% for **Pro users**, and an open rate of 20.54% and a CTR of 0.94% for **AAB users**.*

The announcement email for the Facebook video filters update had an open rate of 18.88% and a CTR of 0.08% in the one email we sent.

The switch from Drip to Lindris makes it harder to draw comparisons, although the decrease in the shown CTR despite sticking to the same technique used for the creation of previous MM emails is something to keep an eye on.

Similarly, the average open rate for the regular newsletters was 22.10% and the average CTR was 0.19%. Once again, it's hard to draw a comparison, especially since the user segment is quite different compared to Drip.

Regarding the switch to Lindris, the instability of service caused issues with sending the emails at the right time during Marketable Moments.

Please share your scoring reasoning (ie "I shared a X score on this Rock because...")

I shared a score of 1 since I need to improve the way I allot time for my tasks.

Supervisor Feedback

I am raising this score to a 2. While you technically landed at 14.7, managing the context-switching between Smash Balloon and WPChat during a launch quarter was a heavy lift, and you successfully delivered the volume we needed.

With that said, applying a growth mindset means we look beyond just the completion of tasks to the results they generate. I appreciate you bringing the specific email data to the table. Taking a data-centric approach is the only way we can improve. The numbers reveal a clear opportunity: a CTR of 0.08% indicates that while the emails are delivering, we have significant room to optimize our messaging for better engagement.

For the next quarter, let's shift our focus from "scheduling" to "optimizing." We will define specific, quantifiable metrics for both blog performance and email engagement in the Looking Ahead section below, so we can ensure your hard work translates into higher traffic and measurable growth.

Reddit Marketing

Self-Evaluation

In 3-5 sentences, please summarize what you did for this Rock.

In regard to Reddit marketing, I created an account on Reddit and used it to upvote relevant content while making regular posts at the same time. I had to switch to a Reddit account created using my work email, which meant starting over from scratch. Fortunately, the new account is created and ready to go at this point.

Please briefly share your reflections on how this rock went. Questions to consider in your reflection: What went well/badly? What was easy/difficult? What did I learn? What do I still need to learn more about? What could I have done better?

For this Rock, most of the effort was spent on boosting the visibility of content relevant to AM while making regular posts at the same time to avoid being flagged as spam.

Having to create a new account did reset some progress, since Reddit requires users to wait a certain amount of time (which is different depending on the subreddit) before they're allowed to make posts.

For the upvoted content itself, a certain number of posts didn't seem to be effective at seeming organic. At the same time, it's just the inception of the Reddit marketing project, so I'm optimistic about what the future of the project will be like.

Please share your scoring reasoning (ie "I shared a X score on this Rock because...")

I set a score of 1 because despite preparing an account and upvoting available posts, I need to develop a clear idea of how I can work on promoting our products on Reddit.

Supervisor Feedback

I agree with your score of 1. While the account setup is done, your reflection misses the bigger strategic picture. We aren't just posting on Reddit to "avoid spam flags". We are doing it to feed Google's AI Overviews.

Since Google trains its AI models on Reddit data, our activity there signals relevance. This is how we bypass traditional SEO barriers and get featured in AI answers even for keywords where we don't rank #1.

For Q1, I want you to shift your mindset from "organic posting" to "SEO signaling." We need to track the impact of this work not just by Reddit upvotes, but by AI-attributed revenue. When you post, are you answering questions that Google's AI is likely to scrape? We need to identify where we can get additional sales from this activity. If traffic comes in but doesn't convert, is it a CTA issue or a landing page issue? Let's focus on these measurable outcomes rather than just the activity of posting. We will discuss the specific tracking metrics you need to monitor in the Looking Ahead section below.

WPChat Blog & Posts

Self-Evaluation

In 3-5 sentences, please summarize what you did for this Rock.

To promote WPChat, I created blog posts for the Smash Balloon blog as well as the WPChat blog. On top of writing new blog posts, I also did edits and rewrites of existing blog posts where WPChat could be promoted.

For the updates, I identified posts on the Smash Balloon blog that got a relatively higher number of sessions and added mentions and tutorial links for WPChat.

Please briefly share your reflections on how this rock went. Questions to consider in your reflection: What went well/badly? What was easy/difficult? What did I learn? What do I still need to learn more about? What could I have done better?

While I believe this Rock presented some challenges, I think I was able to deal with the new tasks and get the promotional content out in time for the Marketable Moment.

Getting all the content out at first was a bit challenging, but once I adjusted the timing of the other tasks, I was able to get the posts done.

An upside of this situation is that I was able to get more use out of the AI tools to streamline the process of creating new posts.

For some of the edits post updates, I combined that with the removal of ClickSocial promotion in regular posts, so they could be replaced with WPChat instead.

Since WPChat is getting new features at a pretty rapid rate, I'm still learning more about the plugin and updated the existing posts to include the features (for example, the newly supported platforms as a selling point for the WhatsApp tutorials).

In the next quarter, I feel ready to tackle a higher volume of blog posts, including TOFU articles to promote WPChat.

Please share your scoring reasoning (ie "I shared a X score on this Rock because...")

I set myself a score of 2 for this Rock since I handled the task of promoting WPChat while adjusting to any changes in the workload.

Supervisor Feedback

I agree with your score of 2. Handling the dual workload of launching the WPChat blog while simultaneously updating high-traffic Smash Balloon posts was a critical component of our launch strategy. The execution on the "output" side was strong and ensured we had a populated blog on Day 1.

As we scale, we must be hyper-aware of SEO cannibalization. We have identified areas where similar content on both sites may compete against each other. Moving forward, I expect you to not just write the content, but to analyze the SERP intent to ensure we are capturing unique traffic rather than splitting our own audience.

Additionally, you mentioned updating posts with new features. This is good, but let's look at the outcome: did those updates drive clicks? For Q1, let's focus on measuring the session quality and conversion rate of these new posts. We need to ensure that replacing ClickSocial with WPChat is actually resulting in new user acquisition.

T1/2/3 Optimizations

Self-Evaluation

In 3-5 sentences, please summarize what you did for this Rock.

Like in the previous quarters, I did regular T123 optimization tasks to update our older posts to try and keep the search ranking up.

Since we had a lower volume of rewrites this time, I included the experimental changes for the optimization tasks where the regular changes weren't having enough of an impact on the search ranking.

In some cases, the changes were a bit more thorough than usual for a minor optimization, but I'm trying to avoid drastic changes in articles that are already performing well.

Please briefly share your reflections on how this rock went. Questions to consider in your reflection: What went well/badly? What was easy/difficult? What did I learn? What do I still need to learn more about? What could I have done better?

While everything was completed in time, I'd have liked there to be enough of a grace period to account for the possibility of any unforeseen obstacles.

At the same time, I'm happy with many of the new methods I put into use and I'm interested in seeing how they pan out in the future.

For the T123 optimization, the new techniques I put to use included:

- *Inclusion of a TL;DR style summary directly as the second paragraph of a post so it's easier for the AI to parse*
- *Switching from bullet points to tables for use-cases, features, or benefits*
- *Using a matter-of-fact tone (instead of a conversational tone) for the plugin promotion with supportive stats*
- *Using descriptive alt text that mention the action as well as the tool used so it's screen reader focused while still highlighting our product*
- *Continuation of older experimental techniques (FAQ section and schema, HowTo schema, nested subheadings instead of longer sections, etc)*

Instead of sticking to this specific style of updates, I'd like to keep tracking the changes and possibly tackle the optimization from another angle in the future.

An improvement I'd like to make is to track even more posts that get a notable amount of transactions and add them to the T123 optimization project.

Please share your scoring reasoning (ie "I shared a X score on this Rock because...")

I set a score of 2 because I finished the optimization tasks while actively trying new things and adjusting to the changes in ranking

Supervisor Feedback

I am marking this rock as a 1. While you completed the optimization tasks and ran interesting experiments, looking at the broader data reveals a gap we need to address.

We saw Sessions increase to 130,199 (+13.28%), but Total Revenue only reached \$5,629.26 (+1.74%). This discrepancy suggests that while we are driving traffic, we aren't converting it efficiently. Unfortunately, because we didn't have an active tracker in place to correlate your specific updates with this data, we can't pinpoint why this gap exists. Was it the new "tabular format"? Was it a specific batch of posts?

Additionally, regarding the content overlap between Smash Balloon and WPChat, we need to be proactive. In the future, I would love for you to track these potential cannibalization conflicts and bring specific examples to our 1:1s, L10s or Smash Balloon Content channel in Slack. Moving forward, let's get a tracker in place so we can ensure your hard work on optimization is driving the revenue numbers we want to see.

AI Adoption

Self-Evaluation

In 3-5 sentences, please summarize where you fit into the [AI Adoption Matrix](#) for your role:

I will put myself as Capable in the AI Adoption Matrix at the moment since I need to work on quantifying the gains made with the help of AI.

Please briefly share your reflections on how AI Adoption went for you. Questions to consider in your reflection: *How did I implement AI? What did I learn?*

I'm getting a much better handle on AI and how it outputs content. Instead of brute forcing until I get the output I like, I'm creating a workflow where I set specific AI tools to use and which tool is suited for which specific portion of my work.

To reduce the amount of time needed, I use my Custom GPT to repurpose tutorials into emails, and use AI to reduce an article to the base actions and adjust the outline with the help of other tools before using it to output new blog posts.

Supervisor Feedback

I agree with your assessment of being at the Capable level. Your use of Custom GPTs to draft outlines and repurpose tutorials into emails aligns perfectly with this stage. You have moved beyond manual drafting and are using tools to speed up the process.

To reach the Adaptive level next quarter, we need to move from "using tools" to "proving results." According to our matrix, here is the roadmap:

- **Systematized Repurposing:** You mentioned repurposing tutorials into emails. To hit the Adaptive level, I want to see you systematize this. Build a documented workflow where we are efficiently

turning long-form tutorials into email newsletters and social snippets, aiming for the matrix benchmark of "repurposing content across formats while maintaining consistency."

- **Measure the Lift:** I'm glad you're using AI for drafting. In Q1, let's start documenting the wins: show me where an AI-generated headline or CTA led to a measurable increase in Click-Through Rate (CTR) or Time on Page compared to our previous baseline. We need documented wins (aiming for +5%).
- **Track Efficiency:** As we discussed in your 15-point Rock, I want you to start tracking exactly how much time your Custom GPTs are shaving off your writing cycle. The goal isn't just to write faster; it is to reduce your manual workload so you have more time to reinvest in strategy and experimentation. This data will help us prove that AI is actually freeing you up to do higher-value work.

I would like to see you begin tracking these efforts in a dedicated tracking sheet to outline where time was spent, your involvement (direct writing or AI-tool used), and the specific growth goal being targeted. Let's discuss these data points and your progress in every 1:1.

Significant Contributions

- *Promotional content prepared in advance for the release of WPChat, including a large number of posts for the new WPChat blog.*
- *For the WPChat 1.2 and Facebook Video Filters Update, created announcement posts, emails, and updated existing content in the blog to account for new filters.*

Supervisor Feedback

While the work listed here—launch content and product updates—was critical to our success this quarter, these items largely overlap with your core Rocks. Applying a growth mindset means looking beyond the "output" of writing posts to the inputs that make you a stronger marketer.

For this section, I would love to see you focus more on Skill Enhancement or Process Improvements that sit outside your daily writing tasks. For the next quarter, diving deeper into Conversion Copywriting or Advanced SEO courses would directly support the "Market Knowledge" pivot we discussed in your KPIs. Investing in those skills is what takes us from simply following a process to driving tangible outcomes. What will set your contribution apart is not just taking the course, but implementing those new techniques to identify and close revenue gaps in our content strategy.

Self Reflection

Top 3 (T3)	Bottom 3 (B3)
<i>Got a better hang of AI and reduced time taken to produce each blog post</i>	<i>Had to adjust the schedule quite a bit to account for the new posts needed for the WPChat blog</i>

Top 3 (T3)	Bottom 3 (B3)
<i>Had the opportunity to test a new plugin and workshop potential angles for promoting the tool</i>	<i>Left the some of the optimization tasks to the end which could have caused some schedule issues for the Q1 Rocks</i>
<i>Tackled experimental updates at a very different angle which could lead to interesting results</i>	<i>Switching to Lindris was difficult, and the reduction in CTR for the MM emails was tough</i>

What tasks do you find most time-consuming or repetitive in your daily/weekly routine? If you've tried/considered leveraging AI/automation in any of these tasks, please summarize.

While I've used AI to reduce the time taken to create new blog posts, I'd like to make the TOFU and other research-heavy blog posts more streamlined by using AI for research and sticking to fact checking instead of getting stuck in the research phase.

How would you rate your happiness in your current position and team?

I'm very happy with my current position here as well as everyone else on the Smash Balloon team.

What are your career goals and where do you see yourself in 12 months from now?

Career-wise, I'm very happy at Awesome Motive, and while I'm not expecting a drastic career change, as the technology changes and grows, I foresee that the role of content writers will adjust as well.

Anything else you'd like to share?

Nothing at the moment.

Supervisor Feedback

It is encouraging to see you list "AI Efficiency" as a top win. Reducing the time it takes to produce a blog post is a critical step toward scalability, and successfully launching WPChat's content strategy while managing that efficiency is a major achievement. You are right to focus on these results—they are the foundation of the growth mindset we want to cultivate.

However, your identified challenge regarding the schedule crunch highlights a process gap we need to close. The answer here isn't just "working harder," but leaning heavier into automation. We need to advance your AI workflows so that the heavy lifting of research and drafting is delegated to the tools. This will free you up to focus on the high-leverage work: refining the narrative and analyzing the data.

As the role of a content writer evolves, so must our approach. To thrive in the coming year, I want you to pivot your focus from the volume of words produced to the value those words generate. By automating the routine parts of your workflow, you can spend your energy on driving growth outcomes—like higher rankings, more traffic, more transactions and better conversion rates—ensuring that every piece of content you ship directly impacts the business.

Looking Ahead

What to expect in the next quarter and new Rocks go here. This will be completed by your Supervisor.

Supervisor Feedback

Writing

Moving forward, we need to evolve how we measure writing success. It is no longer enough to track output (e.g., "I wrote 5 posts"). We need to track efficiency and impact, specifically ensuring that our speed doesn't compromise our brand voice or SEO rankings.

Internal Efficiency: regarding your goal to streamline research-heavy posts, we need to quantify the time saved. In Q1, I want you to track exactly how much time your Custom GPTs are shaving off the drafting phase. If we can save 2 hours per post on research, that is time we can reinvest into higher-level strategy, like A/B testing headlines or optimizing CTAs.

Target Metric: Reduce research and drafting time by 2 hours per post using Custom GPTs.

Success Criteria: Time-tracking logs confirm a measurable reduction in manual effort for TOFU content.

External Growth: I want you to connect your writing to tangible business metrics. We need to solve the "AI bias" issue you identified (robotic phrasing) by proving that your human edits are keeping readers on the page. In our 1:1s, you should be able to state: "Because I manually refined the hook of this AI-drafted post to be more engaging, the Bounce Rate dropped by 5%."

Shift your tracking sheet to include an Attribution Column. Don't just list the blog title; list the business goal and the actual result.

Target Metric: Improve (lower) Bounce Rate by 5% on AI-assisted posts compared to the Q4 baseline.

Success Criteria: Analytics confirm that human-edited hooks and structure are preventing users from leaving immediately, validating the quality of the content

Product Knowledge

We need to evolve your product knowledge from "knowing the features" to "knowing the market." It is not enough to list features; we need to frame them as solutions to specific business pains. This applies to both Smash Balloon and WPChat.

For Q1, I want you to A/B test our hypothesis that "Pain-Point/Benefit Framing" outperforms "Feature Framing." You should use your deep product knowledge to find these angles by looking at:

- Competitor Gaps: Read 1-star reviews on competitor plugins in the WordPress repository. What are users complaining about? Write a post solving that specific frustration with our tool.

- Social Media & Reddit: Monitor threads where users are discussing social feed or chat plugins. What are their specific struggles? Write a topic that directly addresses that thread.
- Support Tickets: What questions are users asking us repeatedly? Turn those questions into "How-To" topics that frame the feature as the answer.

Target Metric: Execute 10 A/B Split Tests (using Blog Topics, Headlines, or Email Subject Lines) comparing "Feature-Focused" vs. "Pain-Point-Focused" angles.

Success Criteria: Documented 5% increase in Pageviews or Revenue Attribution on the "Pain-Point" variants.

Example: "Because we wrote a Smash Balloon post about 'Boosting Trust with User Reviews' instead of 'How to Display a Feed,' we saw a 10% lift in Pageviews and \$X in attributed revenue."

Your Rocks

- 3 Blog Posts written per week
 - Target Metric: Maintain a consistent cadence of publishing 3 high-quality blog posts per week (36 total for Q1) while achieving a tracked reduction of 20% in research/drafting time using AI workflows.
 - Success Criteria: Documented time-logs confirm the efficiency gain, while AI-assisted posts maintain a tracked Bounce Rate equal to or lower than our Q4 baseline (proving speed didn't hurt quality).
- Reddit marketing ramping up
 - Target Metric: Generate 20 tracked Reddit interactions per month (posts or detailed comments) that specifically target keywords relevant to Google's AI Overviews.
 - Success Criteria: Documented evidence of at least 5 instances where our Reddit activity appears in Google AI Overviews or drives measurable referral traffic/sales in Google Analytics.
- T1/2/3 Optimizations
 - Target Metric: Optimize and document optimization of 10 Top-Performing Posts specifically for conversion (e.g., updating CTA placement, adding "Trust" signals, or testing new tabular formats).
 - Success Criteria: A tracked 10% increase in Revenue Attribution from the optimized cohort compared to their previous quarter performance, documented in our attribution sheet.

AI Adoption Goals

Select a specific goal from the "Adaptive" level of our AI framework, one that aligns directly with your growth and content strategy, and show consistent progress on it throughout Q1.

Instead of only using AI to generate outlines or drafts, I want you to push into automation and risk detection. This includes using AI to analyze our current content strategy, identify "failure points" in our messaging (like the "robotic phrasing" bias you identified), and research competitor trends to find new growth opportunities.

Pick a consistent system to quantify your progress. This could be Time Savings (e.g., “Using a custom GPT reduced my research and drafting time by X hours per week”) or Content Performance (e.g., “AI-optimized headlines increased our Click-Through Rate by Y%”), etc.

We will make this a standing item in our 1:1s. Be prepared to share your initial data points and explain how you are iterating on your AI workflows to drive better outcomes for Smash Balloon and WPChat.

KPI Scoring

Below is a breakdown of KPI scores and what each number means.

SCORE	DESCRIPTION
N/A	You were not able to start. <i>Work did not start due to external factors or was postponed by the manager.</i>
0	You encountered significant problems. <i>Work had critical issues, or did not meet any expectations</i>
1	You have room for growth and/or areas that can be improved. <i>Work needed changes, didn't meet all expectations, or wasn't fully completed.</i>
2	You did a great job and met our very high expectations. <i>Work was solid and on point.</i>
3	You crushed it and exceeded our very high expectations. <i>Work went above and beyond the call of duty.</i>
4	You made the needle move. <i>Work impacted or transformed the business in a measurable way.</i>
